

Clinical Studies SKINSECRET Anti-Aging Moisturizing Face Cream

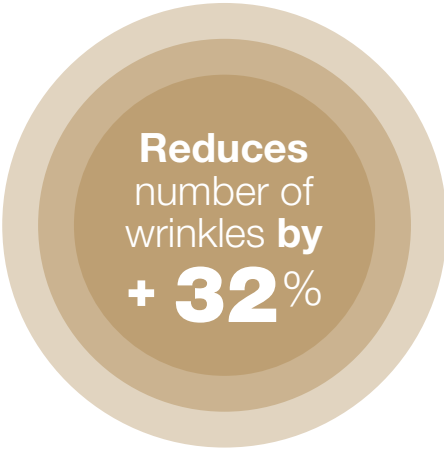

Clinically proven results in younger skin

After age 30 it becomes critical to adopt skin care that will help prevent aging.

In a clinical study performed with SKINSECRET Anti-Aging Face Cream, 30 Portuguese women aged 30 to 45 used the cream twice daily only on one side of their face. After 28 days of usage the SKINSECRET Anti-Aging Face Cream guaranteed a noticeable **32% reduction in wrinkles** in the periocular area (wrinkles commonly known as crow's feet), as determined by high sensitivity measuring equipment.

In addition, at the end of the cream usage period, there was a **significant reduction in the number of skin spots**, which are one of the most evident signs of the skin's aging process, **the anti-aging effect of this face cream thus having been clinically proven.**

Use of SKINSECRET Anti-Aging Face Cream also led to a **significant increase in skin moisturization.**

imaging provided by Primos 3D® equipment.

This figure shows a reduction in the number and length of wrinkles after 28 days of using SKINSECRET Anti-Aging Face Cream.

Clinical results have been confirmed by the opinion of the study participants

Over 90% of women participating in the study said they liked SKINSECRET Anti-Aging Face Cream or liked it a lot. Participants said their **skin felt softer and more moisturized** and they emphasized the texture of the SKINSECRET Anti-Aging Face Cream.
