

Clinical Studies SKINSECRET Anti-wrinkle Face Cream

Clinically proven results

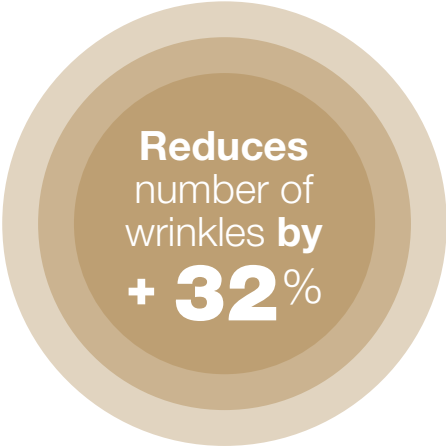

32% reduction in the number of wrinkles in women aged between 45 and 60.

It is natural and a sign of maturity to reach an age in which wrinkles are more difficult to hide or diminish.

During the study of this product, 32 Portuguese volunteers aged 45 to 65 used the SKINSECRET Anti-wrinkle Face Cream twice a day only on one side of the face. **After only 28 days**, equipment used to measure high sensitivity determined an **average reduction of over 32% in the number of wrinkles** in the periorcular area (wrinkles commonly known as crow's feet) and a significant reduction in their length, on the side of the face on which the product was used.

The same study showed a significant reduction in the number of brown spots and spots related to photoaging, exhibiting a veritable anti-aging effect.

Use of the SKINSECRET Anti-wrinkle Face Cream also resulted in a **significant increase in skin moisturization, along with firmness and elasticity.**

Comparison between wrinkles on day 0 versus day 28 of using the SKINSECRET Anti-wrinkle Face Cream via 3D

imaging provided by Primos 3D® equipment.

This figure shows a reduction in the number and length of wrinkles after 28 days of using SKINSECRET Anti-wrinkle Face Cream.

From the clinic to practical application: high approval rating among study participants

Opinion concerning the Anti-wrinkle Face Cream by participants was almost unanimous: **over 96% of women said their skin showed improvement.** In fact, this same amount of participants said they felt that their **skin was more moisturized and softer.**

Previous results justify the high satisfaction rate of users of SKINSECRET Anti-wrinkle Face Cream: **over 96% said they like the product or liked it a lot!**
